### **Abstract**

*Bolbelasmus (Bolbelasmus) zagrosensis* Sommer, Hillert, Hružová & Král, **new species**, from Iran is described, illustrated and compared with its congeners known from the western Palaearctic region. An updated key to the western Palaearctic species of the nominotypical subgenus is provided. New country record of *B. (B.) nireus* (Reitter, 1895) from Greece (island of Rhodes) is reported. Distribution of *B. (B.) makrisi* Miessen, 2011, *B. (B.) nireus* and the new species is summarized and mapped.

**Key words:** Coleoptera, Scarabaeoidea, Bolboceratidae, Bolboceratinae, *Bolbelasmus*, taxonomy, new species, distribution, Iran, Rhodes, Palaearctic region

### **Introduction**

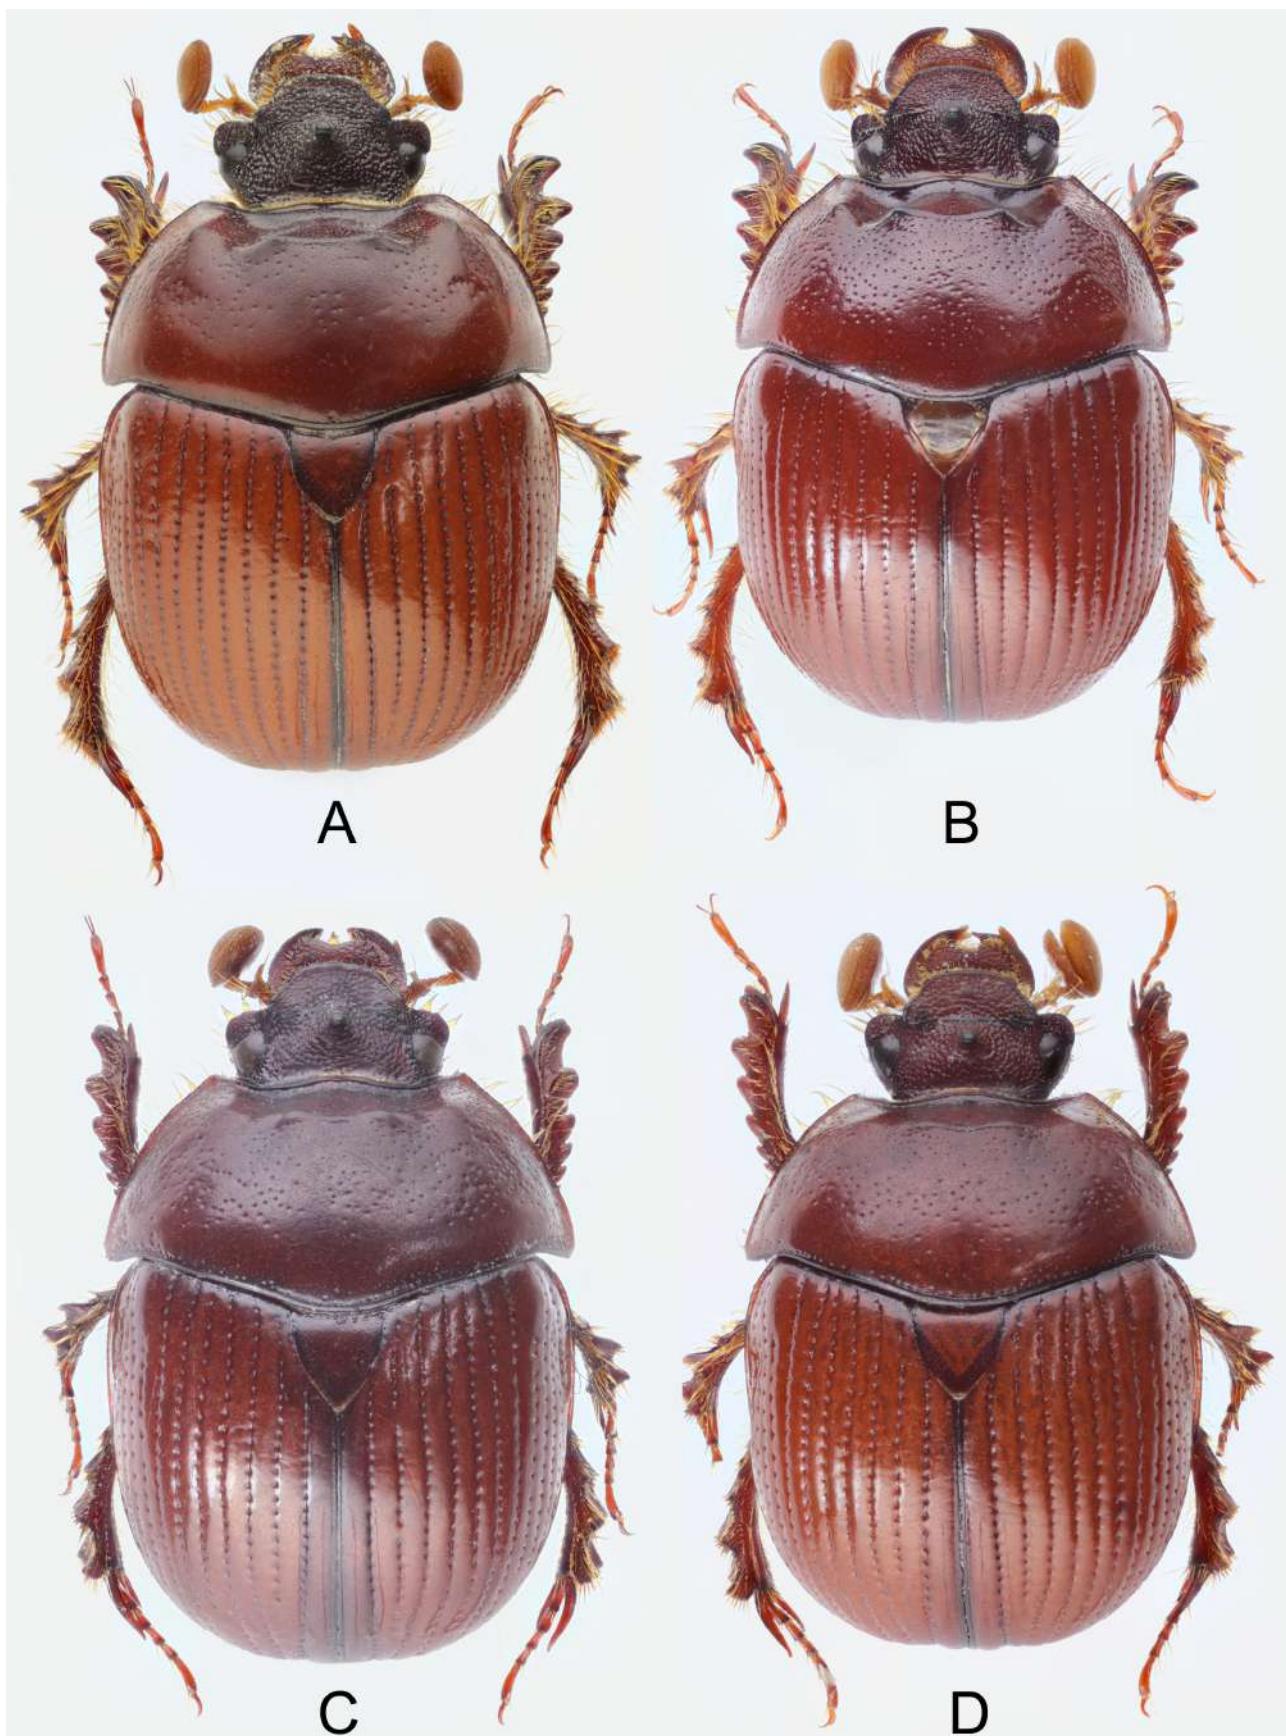

The genus *Bolbelasmus* was described by Boucomont (1911) and in the current concept it is classified into two subgenera (*Bolbelasmus* Boucomont, 1911 and *Kolbeus* Boucomont, 1911) with 28 formally described species (Hillert *et al.* 2016; López-Colón & Bahillo de la Puebla 2016; Nikolajev *et al.* 2016; Schoolmeesters 2020). Eight taxa are distributed throughout the New World (Howden 1964; Howden & Solís 1995), eleven are known from Europe and the Mediterranean Region (Krikken 1977; Hillert *et al.* 2016) and nine are native to the Himalaya, Far East of Russia, eastern and south-eastern Asia (Krikken 1977; Li *et al.* 2008).

### **Material and methods**

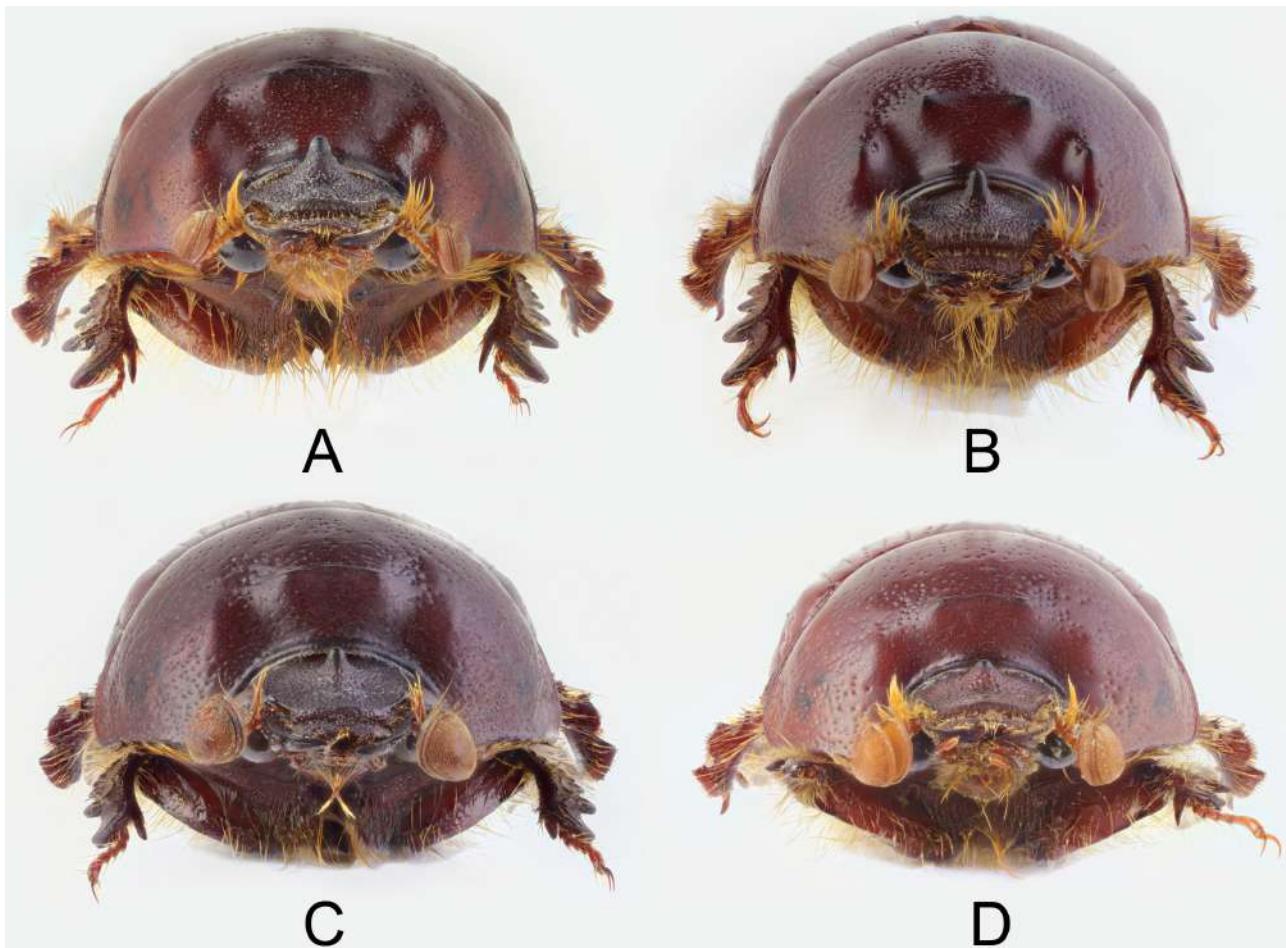

Material was examined with an Olympus SZ61 stereomicroscope and a Nikon SMZ 745 stereomicroscope, measurements were taken with an ocular grid. The habitus photographs were taken using a Canon EF-S 60mm f/2.8 Macro USM lens attached to a Canon EOS 70D camera. Partially focused images of each specimen were combined using Zerene Stacker (Zerene Systems LLC, Richland, USA). All pictures were digitally enhanced using Adobe Photoshop CC. The distribution maps were produced and edited in ESRI ArcMap 10.6 of ArcGIS Desktop 10.6 suite. For map layers, free levels 0–1 data from Global Administrative Areas (<http://www.gadm.org>, ver. 2.8), Natural Earth (<http://natural-earth-data.com>, Natural Earth I with Shaded Relief, Water, and Drainages), combined with World Shaded Relief (<https://www.arcgis.com/home/item.html?id=9c5370d0b54f4de1b48a3792d7377ff2>) (with 45% transparency) were used. Coordinates and altitude are assigned for each locality mentioned in the text (material examined in each species) (see gazetteer, Table 1). These data were used in the construction of distribution maps (see Figs. 9–10).

**TABLE 1.** Gazetteer of the known collecting localities of *Bolbelasmus* (*B.*) *makrisci* Miessen, 2011, *B.* (*B.*) *nireus* (Reitter, 1895) and *B.* (*B.*) *zagrosensis* Sommer, Hillert, Hružová & Král, new species, with their geographic coordinates and altitude data; \* type localities

ZKCP—Zdeněk Košťál collection, Pardubice, Czech Republic.

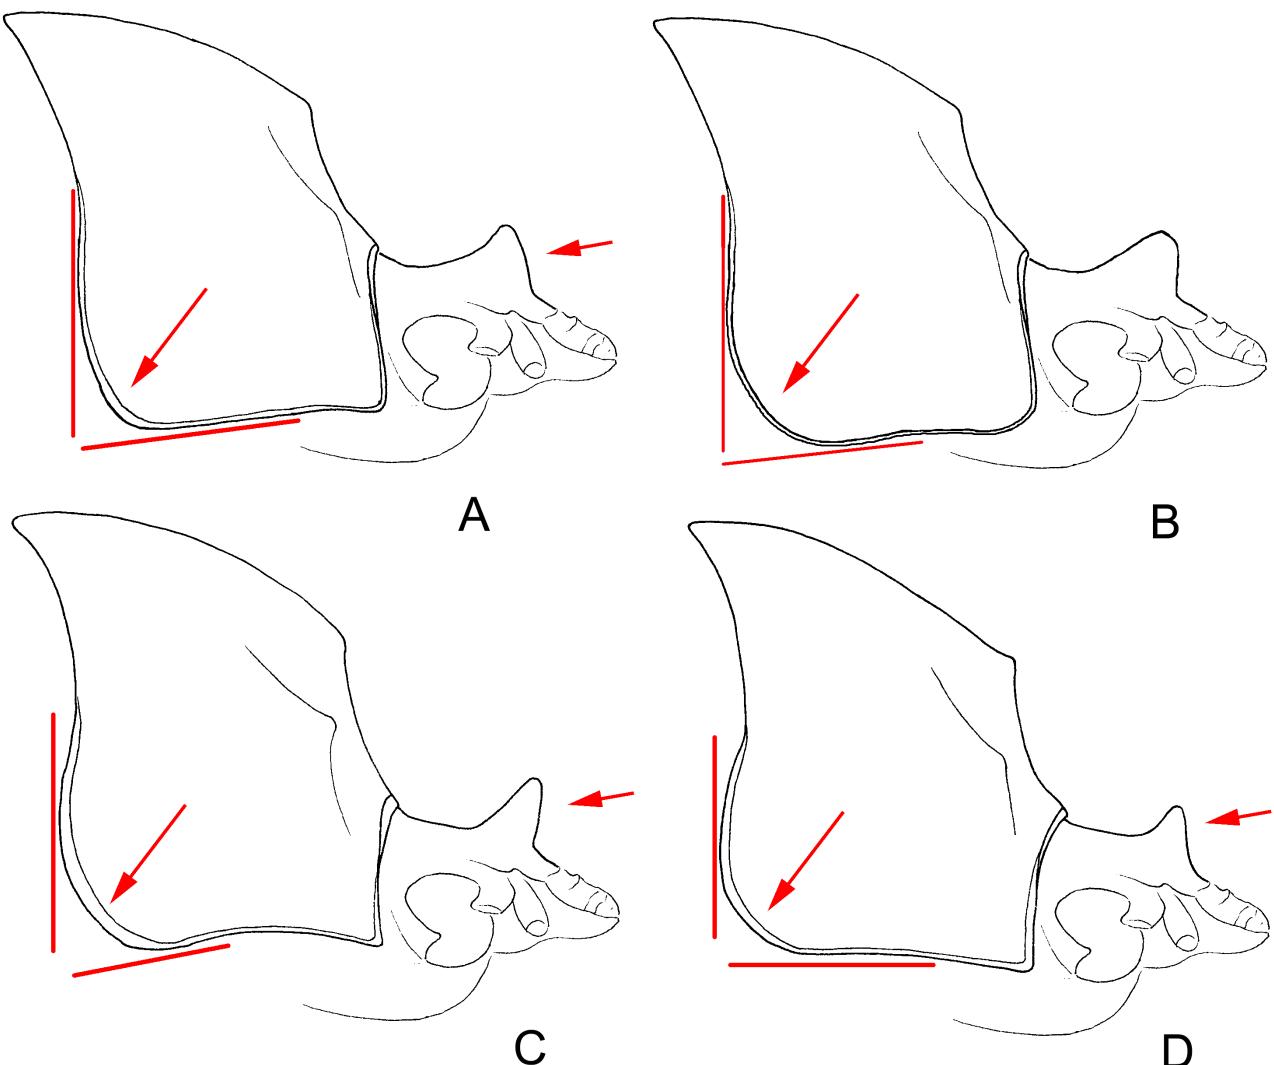

Specimens of the newly described species are provided with one red printed label “*Bolbelasmus* (*Bolbelasmus*) | *zagrosensis* sp. nov. | HOLOTYPE ♂, ALLOTYPUS ♀ [or] PARATYPUS ♂ [or] ♀ | David Sommer, Oliver Hillert | Lucie Hrůzová & David Král det. 2020”. Verbatim label data are cited for the type material, individual lines of every label are separated by a vertical bar (“|”), individual labels by a double vertical bar (“||”). Information in quotation marks (“ ”) indicates the original spelling. Our remarks and additional comments are found in brackets (“[]”), [p]—preceding data within quotation marks are printed, [hw]—the same but handwritten.

Morphological terminology used in the description of adults mainly follows Hillert *et al.* (2016).

Additional specimen information of the two *Bolbelasmus* species were provided as follows.

**FIGURE 3A–D.** Habitus of males in lateral view. A, holotype of *Bolbelasmus zagrosensis* Sommer, Hillert, Hrůzová & Král, new species; B, *B. makrisi* Miessen, 2011; C, *B. nireus* (Reitter, 1895) from Greece (Rhodes); D, *B. nireus* from Turkey. Not to scale.

**FIGURE 4A–D.** Pronotum of males in lateral view. A, *Bolbelasmus zagrosensis* Sommer, Hillert, Hrůzová & Král, **new species**, from Fars province, Iran; B, *B. zagrosensis* Sommer, Hillert, Hrůzová & Král, **new species**, from Lorestan province, Iran; C, *B. makrisi* Miessen, 2011; D, *B. nireus* (Reitter, 1895) from Greece, Rhodes. Not to scale.

Snížek lgt.; 2 ♂♂ (MNHN), Adana [without date and collector’s name].

**Distribution.** Iraq, Syria and Turkey (Nikolajev *et al.* 2016). New country record for Greece (island of Rhodes) (see map, Fig. 9). The record of the species *B. (B.) unicornis* (Schrank, 1789) from the island of Rhodes by Schatzmayr (1936) most likely relates to the species *B. (B.) nireus*.

**Note.** The distribution in Iraq is based on a single female specimen from Assur tentatively assigned to this species by Krikken (1977). We have not studied this specimen, so we cannot confirm with certainty what species it belongs to. In addition, this Iraqi locality of the species is very far from its distribution in Turkey (see map, Fig. 9). Their distribution in Syria is based on two females (including the holotype) collected at “Akbes”. This locality, nowadays a small village Maydân Akbis belongs to the territory of Syria (Aleppo Governorate) and is situated very close to the border with Turkey (see map, Fig. 9). Between 1881–1926 there was the Trappist monastery “Abbaye d’Akbès” (Le Bras *et al.* 1979). The site is not in modern Turkey, as stated in some papers, see Kryštufek *et al.* (2001), Keith (2005) or Arnone & Massa (2010).

**Additional material** (1 specimen). **Iran, Ilam Province:** 1 ♀ (MNHN), Chaldée Persane, Aivan-i-Kerkha [see Note below], alt. 1200 m, 1904, J. D. Morgan lgt.

**Description. Male (holotype ♂)** (Figs. 1A, 2A, 3A). **Body.** Remarkably convex, surface brown, shiny, pronotum covered with punctuation double in size, elytral surface microsculptured to smooth apically.

**Head** (Figs. 1A, 2A, 3A). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin elevated. Frontal horn very weakly developed, short, simple, conical, weakly spaced from frontoclypeal carina (viewed from above), directed up- or weakly backwards. Punctuation of clypeal disc simple, distinct. Oblique keels above eyes reaching to approximately posterior part of eyes. Punctuation of front and vertex same as on clypeus; fronto-clypeal suture present. Eye cantus regularly rounded and almost not exceeding eye laterally.

*Pronotum* (Figs. 1A, 2A, 3A, 4A–B) distinctly transverse; broadest just at basal quarter, bordered except of interruption laterally of scutellum, lateral margin broadly rounded, regularly bent from anterior angle to middle, anterior corners of pronotum distinctly acuminate, marginal carina not crenate, distinctly widened and elevated; lateral fovea almost missing. Pronotal punctation distinct, double in size, punctures coarse, separated less than diameter of puncture, intermixed with considerably fine, sparse punctures. Lateral hornlike apophyses weakly tuberculate. Apical hornlike apophysis weakly elevated, joined in keel-like seam.

*Scutellum* triangular, acuminate apically, finely punctate, shiny.

*Elytra* (Figs. 1A, 3A) approximately as long as wide, surface shiny, glabrous; seven distinct striae between suture and humerus along entire elytral length, all striae with distinctly confluent punctures; intervals convex; humeral umbone weak.

*Ventral side.* Surface brown, shiny with long yellow-brown setae.

*Legs* (Fig. 1A). Protibia with seven external denticles, terminal spur acuminate, reaching end of protarsomere II.

*Aedeagus.* Parameres as in Fig. 5A.

**Variability in males.** Surface pale to dark brown; pronotal hornlike apophyses in moderately developed and poorly developed (hypothetic) specimens short, more or less straight, tips rounded to acute.

**Female (allotype ♀)** (Fig. 6A–C). *Head* (Fig. 6A–C). Clypeus broadly rounded, nearly semicircular, anterior angles vague. Posterior angles of clypeal margin very weakly elevated. Frontal carina tuberculate, well developed, not interrupted. Punctuation of clypeus, frons, vertex and occiput simple, distinct; oblique keels above eyes distinct, elongated to posterior part of eyes; eyes well developed, nearly rounded, genae well developed, evenly rounded and distinct, extending laterally.

*Pronotum* (Fig. 6A–C) distinctly transverse, lateral margin weakly widened, broadest basally, surface deeply punctate, except of basal part double in size, punctures coarse, separated less than diameter of puncture, intermixed with fine, pinned punctures. Anterior transverse protrusion distinct, sharply semicircular, emarginated in middle, lateral apophyses present, almost invisible.

*Elytra* (Fig. 6A–B). Surface shiny, glabrous; humeral umbone weak.

**Variability in females.** Smaller females with less noticeable anterior transverse protrusion.

**Measurements.** Body length 10.5–12.2 mm (holotype, ♂: 11.5 mm; allotype ♀: 12.0 mm).

**Differential diagnosis.** Refer to species key below. Females and small undeveloped males are morphologically practically indeterminate.

**Collecting method.** Most type specimens were collected at light trap.

**Etymology.** The specific name “zagrosensis” refers to the type locality of the new species, Zagros Mts. in Iran.

**Distribution.** Western Iran (see map, Figs. 9–10).

**Note.** The distribution in Ilam province is based on a single female specimen (not included in the type series) from the locality “Chaldée Persane, Aivan-i-Kerkha” close to the “Kabir Kouh” mountains north of Dehloran, see Théry (1925) and Ghahari *et al.* (2015) for details.

## Key to the subgenus *Bolbelasmus* species from the western Palaearctic Region

(modified from Hillert *et al.* 2016)

1. Posterior margin of pronotum incompletely bordered, interrupted laterally of scutellum. .... 2
- Posterior margin of pronotum completely bordered. .... 6
2. Lateral margin of pronotum nearly semicircular between anterior angles and midline in dorsal view, anterior angles almost rounded; frontal horn and medial hornlike apophysis of pronotum distinct; scutellum triangular, approximately as long as wide; body length 11.0–13.5 mm; southern parts of central Europe, France (Alsace), Italy, Balkan Peninsula, Poland, Russia and Ukraine; Asian part of Turkey ..... *B. (B.) unicornis* (Schrank von Paula, 1789)
- Lateral margin of pronotum broadly rounded, regularly bent from anterior angle to middle, anterior corners of pronotum distinctly acuminate, lateral margin straight in front of anterior angles; frontal horn and medial hornlike apophysis of pronotum always indistinct; scutellum triangular, longer than wide; body length 9.5–12.0 mm; Cyprus, Greece (Rhodes), Iran, Iraq, Syria and Turkey. .... 3
3. Eye cantus weakly acuminate and distinctly exceeding eye laterally; scutellum rounded apically; Asian part of Turkey. .... *B. (B.) tauricus* Petrovitz, 1973
- Eye cantus regularly rounded and not exceeding eye laterally; scutellum acuminate apically. .... 4

4. Frontal horn weakly spaced from fronto-clypeal carina (viewed from above), pronotal punctuation double and dense, small punctures sparser; frontal horn directed upwards to weakly backwards (Figs. 3A, 3C–D, 4A–B, 4D). ..... 5
- Frontal horn close to fronto-clypeal carina (viewed from above); pronotal punctuation double and dense, small punctures denser; frontal horn directed obliquely forwards (Figs. 3B, 4C); aedeagus as in Fig. 5B; Cyprus. .... *B. (B.) makrisi* Miessen, 2011
5. Border of posterior margin of pronotum weakly interrupted laterobasally, but with only several single punctures; frontal horn directed weakly backwards (Figs. 3C–D, 4D); aedeagus as in Fig. 5C; Greece (Rhodes), Iraq, Syria and Asian part of Turkey. .... *B. (B.) nireus* (Reitter, 1895)
- Border of posterior margin of pronotum distinctly interrupted laterobasally, single punctures absent; frontal horn directed upwardly (Figs. 3A, 4A–B); aedeagus as in Fig. 5A; Iran. .... *B. (B.) zagrosensis* Sommer, Hillert, Hrůzová & Král, new species
6. Scutellum impunctate or finely, shallowly punctate; frontal horn simple or furcate apically. .... 7
- Scutellum densely punctate; apex of frontal horn simple. .... 11
7. Frontal horn simple; genae evenly rounded; oblique keel above eye longer than length of eye; head strongly constricted behind eye. .... 8
- Frontal horn furcate apically; genae more or less angulate anterolaterally; oblique keel above eye reaching to anterior part of eye; head not strongly constricted behind eye. .... 9
8. Body surface blackish; pronotal punctuation dense and distinct, separated by distance of 1–2 punctures combined; Algeria, Italy (Sicily) and Tunisia. .... *B. (B.) vaulogeri* (Abeille de Perrin, 1898)
- Body surface brownish; pronotal punctuation sparse but distinct, separated by distance of 3–4 punctures combined; Greece (Crete, Kasos). .... *B. (B.) keithi* Miessen & Trichas, 2011
9. Frontal horn short (not longer than wide), apex of horn approximately as wide as base of horn; pronotal punctuation denser with exception of basal part, puncture separated by diameter of puncture; pronotal base with fine and regularly spaced punctures, punctures in shape of pinned points; elytral striae well impressed, completely developed; elytral intervals moderately convex; Spain. .... *B. (B.) brancoi* Hillert & Král, 2016
- Frontal horn long (longer than wide), tapering apically; pronotal punctuation sparser, puncture separated approximately by three their diameters; pronotal base with fine, poorly visible and well separated punctures, punctures in shape of pinned points; elytral striae not impressed, punctures in row visible; elytral intervals flat; northern Africa. .... 10
10. Frontal horn parallel to anterior part of eyes; horn sharply keeled at basal half; middle hornlike apophysis of pronotum directed upwards, subapical protrusion situated basally; lateral hornlike apophyses of pronotum directed forwards; Algeria and Morocco. .... *B. (B.) bocchus* (Erichson, 1841)
- Base of frontal horn parallel to level of posterior part of eyes; horn broadly keeled apically; middle hornlike apophysis of pronotum directed obliquely, subapical protrusion situated at apex; lateral hornlike apophyses of pronotum directed forwardly; Egypt, Libya and Tunisia. .... *B. (B.) nikolajevi* Hillert, Arnone, Král & Massa, 2016
11. Apex of frontal horn tapering apically, acute, weakly flattened in anterior part of horn; Spain and Gibraltar. .... *B. (B.) howdeni* Hillert & Král, 2016
- Apex of frontal horn roughly as wide as base, apex broadly acute, strongly flattened in anterior part of horn; France (including Corsica), Portugal and Spain. .... *B. (B.) gallicus* (Mulsant, 1842)

**Note.** Recently described species *B. (B.) casanovaorum* López-Colón & Bahillo de la Puebla, 2016 is not included in the key because the authors did not have any study material available. The species, so far known only from the holotype, is compared in the original description with *B. (B.) gallicus* and *B. (B.) howdeni* (see López-Colón & Bahillo de la Puebla, 2016: 269, figs. 1–9 for details).

## Acknowledgements

We thank all colleagues and institutions listed in the Material and methods section for enabling us to study the material in their care. Special thanks are due to Petr Benda (NMPC), Petr Kabátek (Prague, Czech Republic), Vítězslav Kubán (Šlapanice u Brna, Czech Republic), Olivier Montreuil (MNHN), Martin Rejzek (Norwich, United Kingdom), Vladimír Vohralík (Department of Zoology, Charles University, Prague, Czech Republic) and Mark Volkovitsh (Institute of Zoology, Russian Academy of Science, Sankt Pétersburg, Russia) for providing hard-to-reach literature and helping to identify some localities. We also thank Robert Angus (London, United Kingdom) for kindly correcting the English and both reviewers, Chun-lin Li (National University of Taiwan, Taipei, Taiwan) and Stefano Ziani (GeoL@b APS, Faenza (RA), Italy), for critical comments to the manuscript. The work of Lucie Hrůzová and David Sommer was supported by the Institutional Research Support grant of the Charles University, Prague (No. SVV 260571/2021).
